Bingo Board

UI concepts for a light, airy mission fuel planner

Six screens exploring how the planner could look: plenty of white space, one strong visual idea (the fuel curve), and colour reserved for fuel states that matter.

The curve is the hero

Fuel remaining across the legs is the one picture every screen returns to.

Colour means something

Blue is normal, teal is fuel gained, amber is joker, red is bingo. Nothing else is coloured.

Quiet structure

Hairlines and whitespace instead of heavy boxes. Panels only where they group a job.

Palette

Ink	#152839
Mist	#F5F8FA
Horizon blue	#2A6BAE
Tanker teal	#1F8C78
Joker amber	#B97C12
Bingo red	#BF4338

Type

Manrope

One family throughout, with tabular figures so fuel numbers line up.

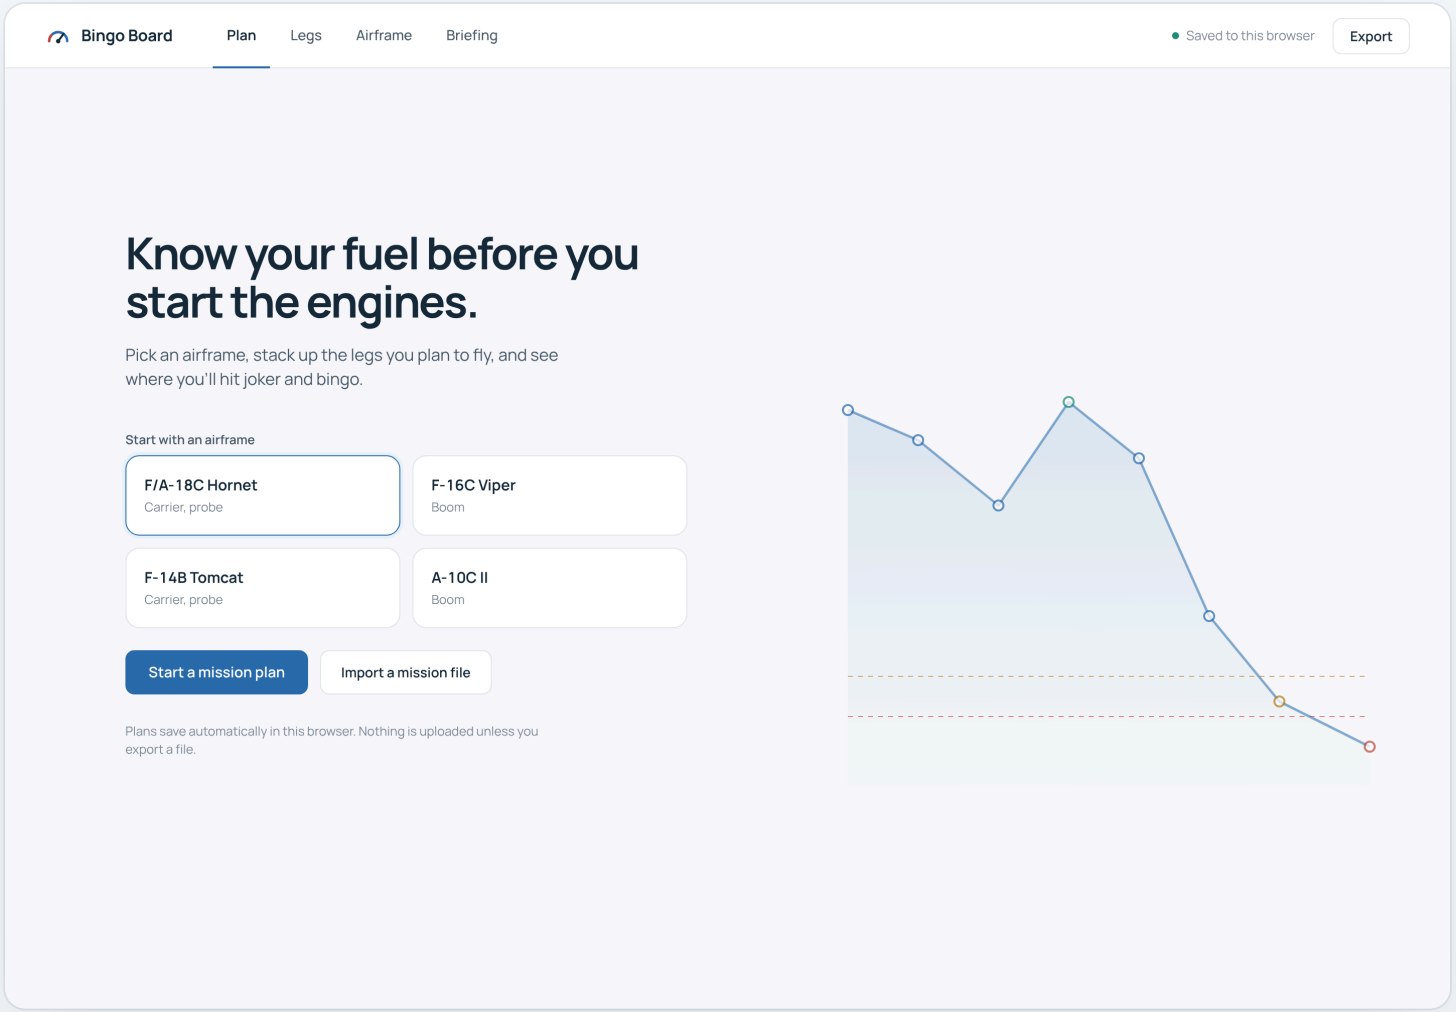

13,060 4,500 3,500

Screen 1 of 6

First run

An open, uncluttered start. The fuel curve is the product's signature, so it appears faintly from the very first screen.

- One clear action: pick an airframe and start a plan.
- Import sits right beside it for missions shared by your flight.
- States plainly that plans stay in the browser.

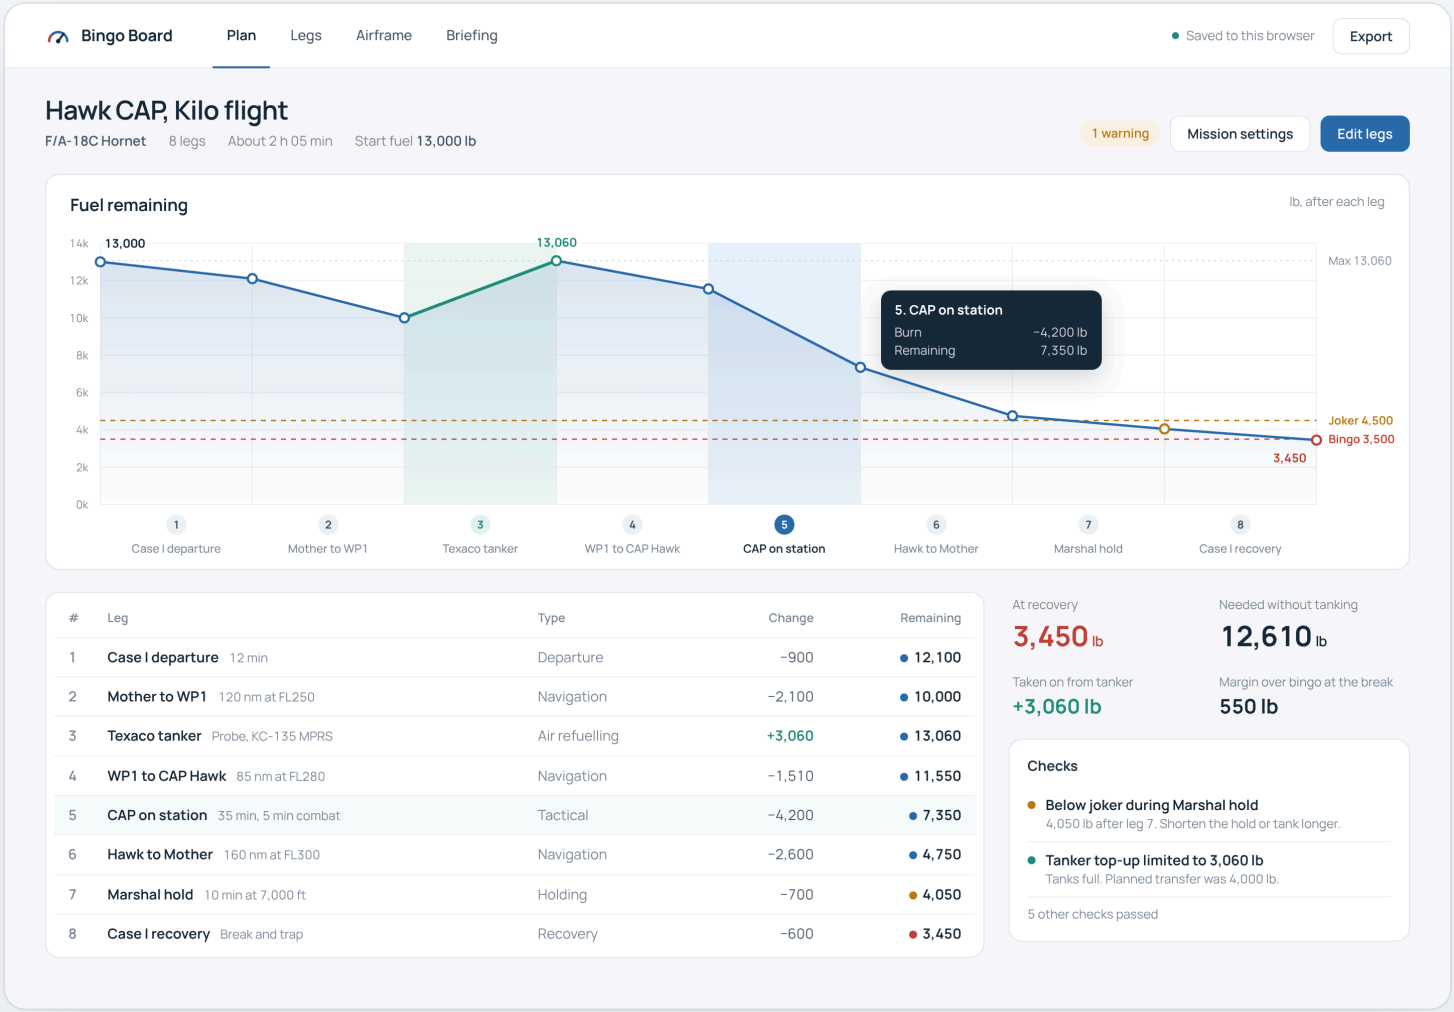

Screen 2 of 6

Mission plan

The fuel curve leads the page. Every leg is a band on the chart and a row in the table, so you can read the plan either way.

- Joker and bingo are dashed lines you can't miss; points change colour as they cross them.
- Tanker legs get a soft teal band, matching the green +fuel figures.
- Checks sit beside the numbers and say what to do next, not just what's wrong.

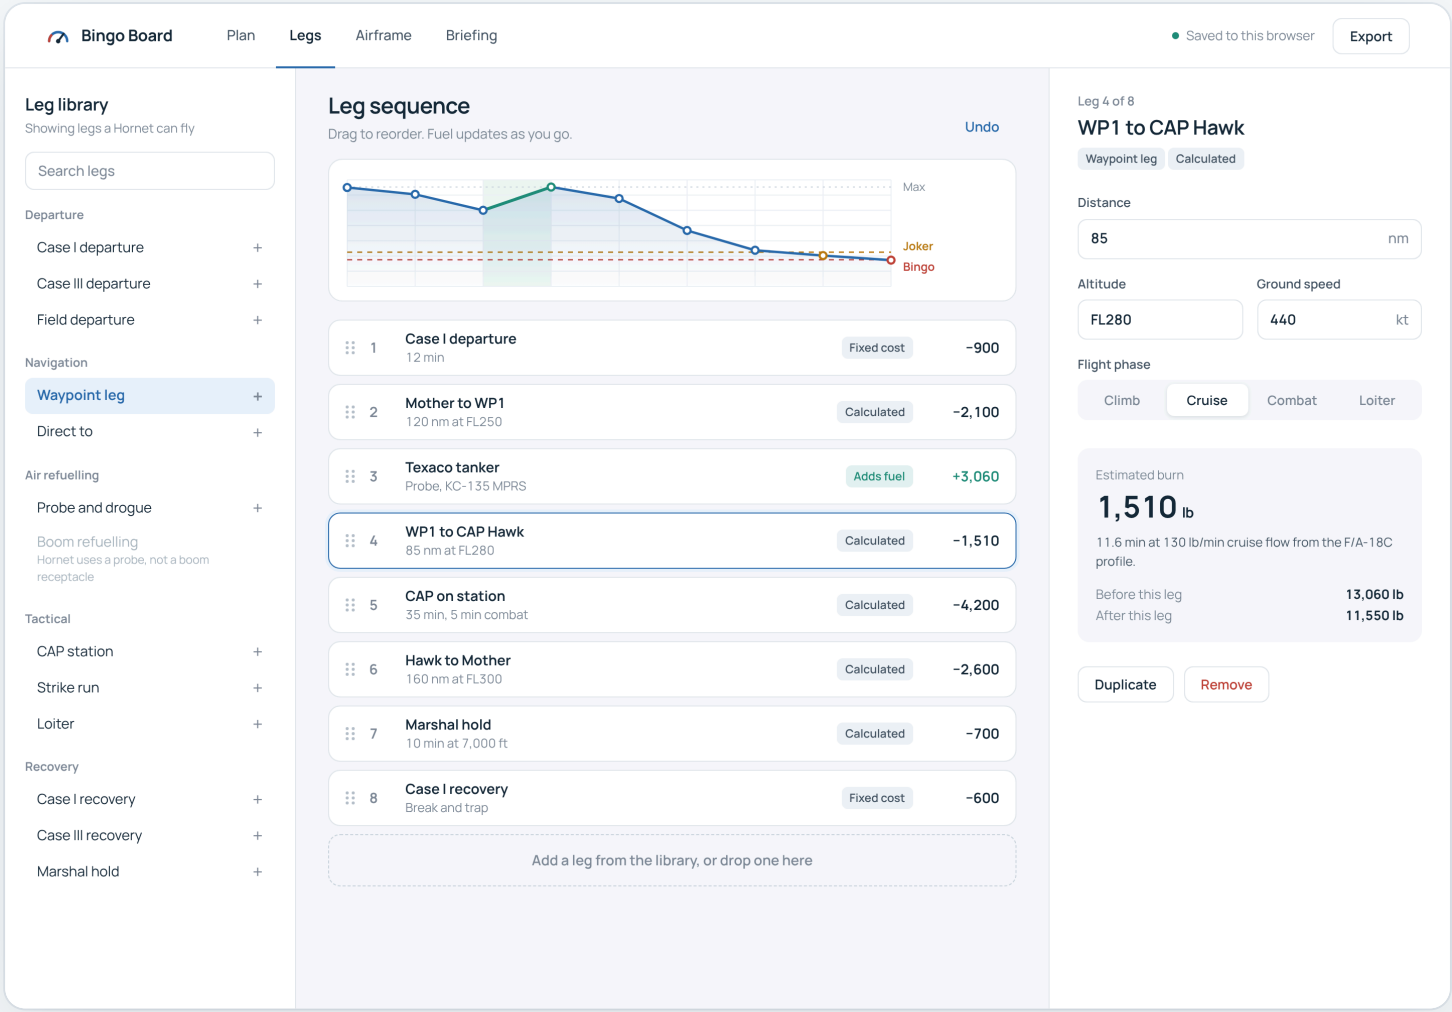

Screen 3 of 6

Leg builder

Three calm columns: library, sequence, editor. A small fuel curve above the sequence redraws as legs are reordered or edited.

- The library only offers legs the airframe can fly; unavailable ones explain why rather than vanish.
- Each leg shows whether its cost is fixed, calculated or adds fuel.
- The editor previews the burn and the before/after fuel for the selected leg.

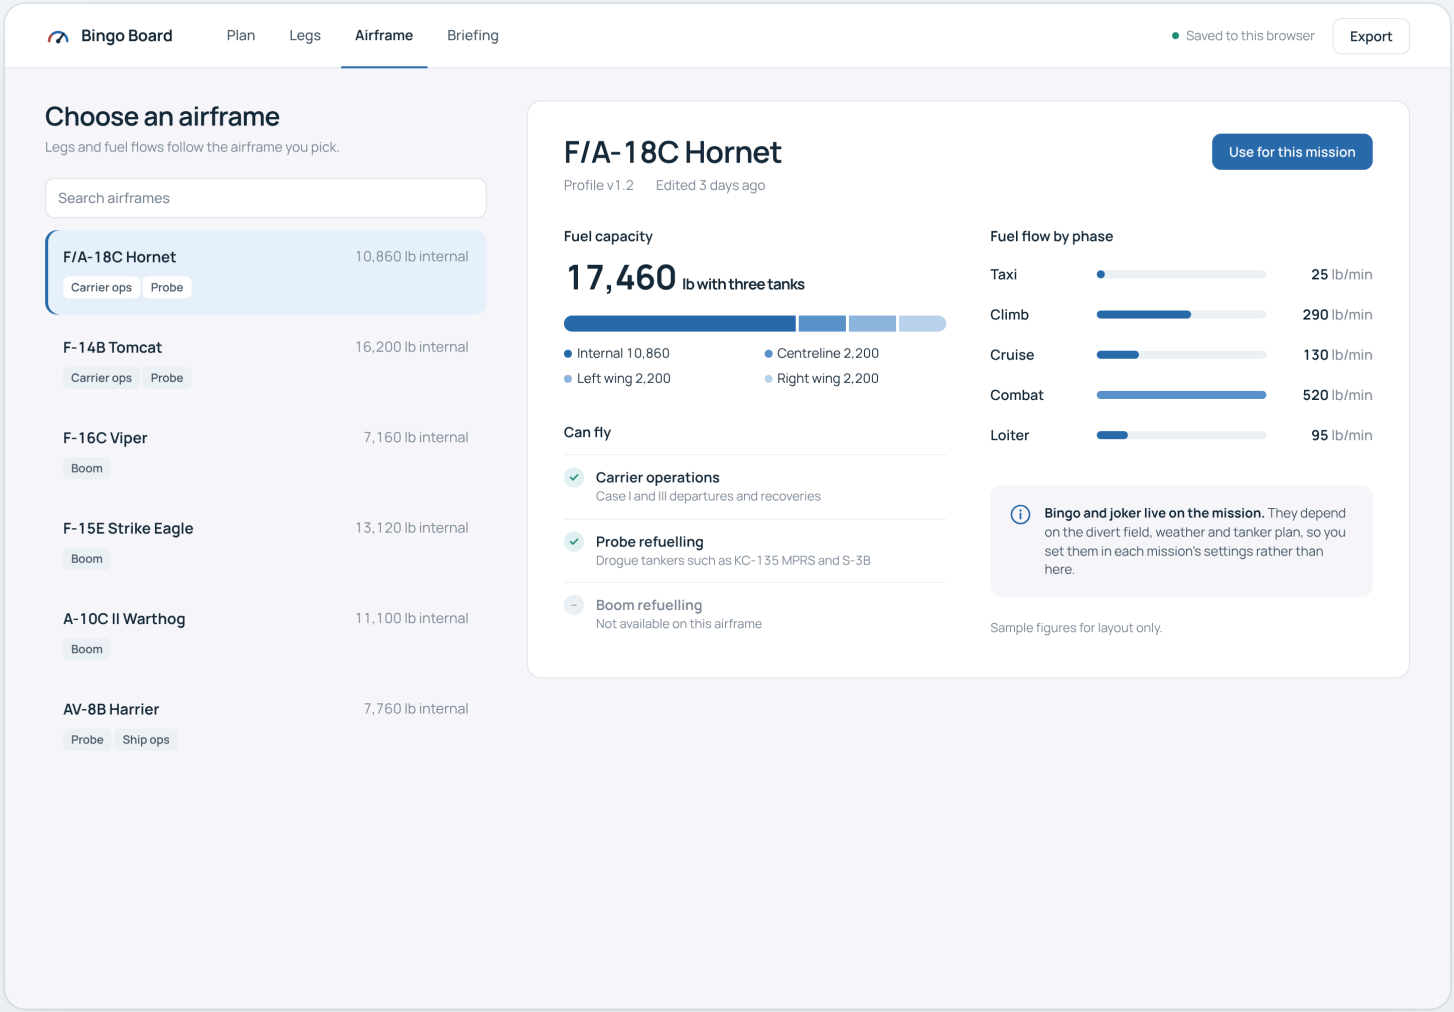

Screen 4 of 6

Airframe profiles

A profile page that reads like a spec sheet: capacity, tank breakdown, fuel flow per phase and the capabilities that gate legs.

- Capacity bar splits internal and external tanks at a glance.
- Capability list ties directly to what appears in the leg library.
- A note reinforces the domain rule: bingo and joker belong to the mission.

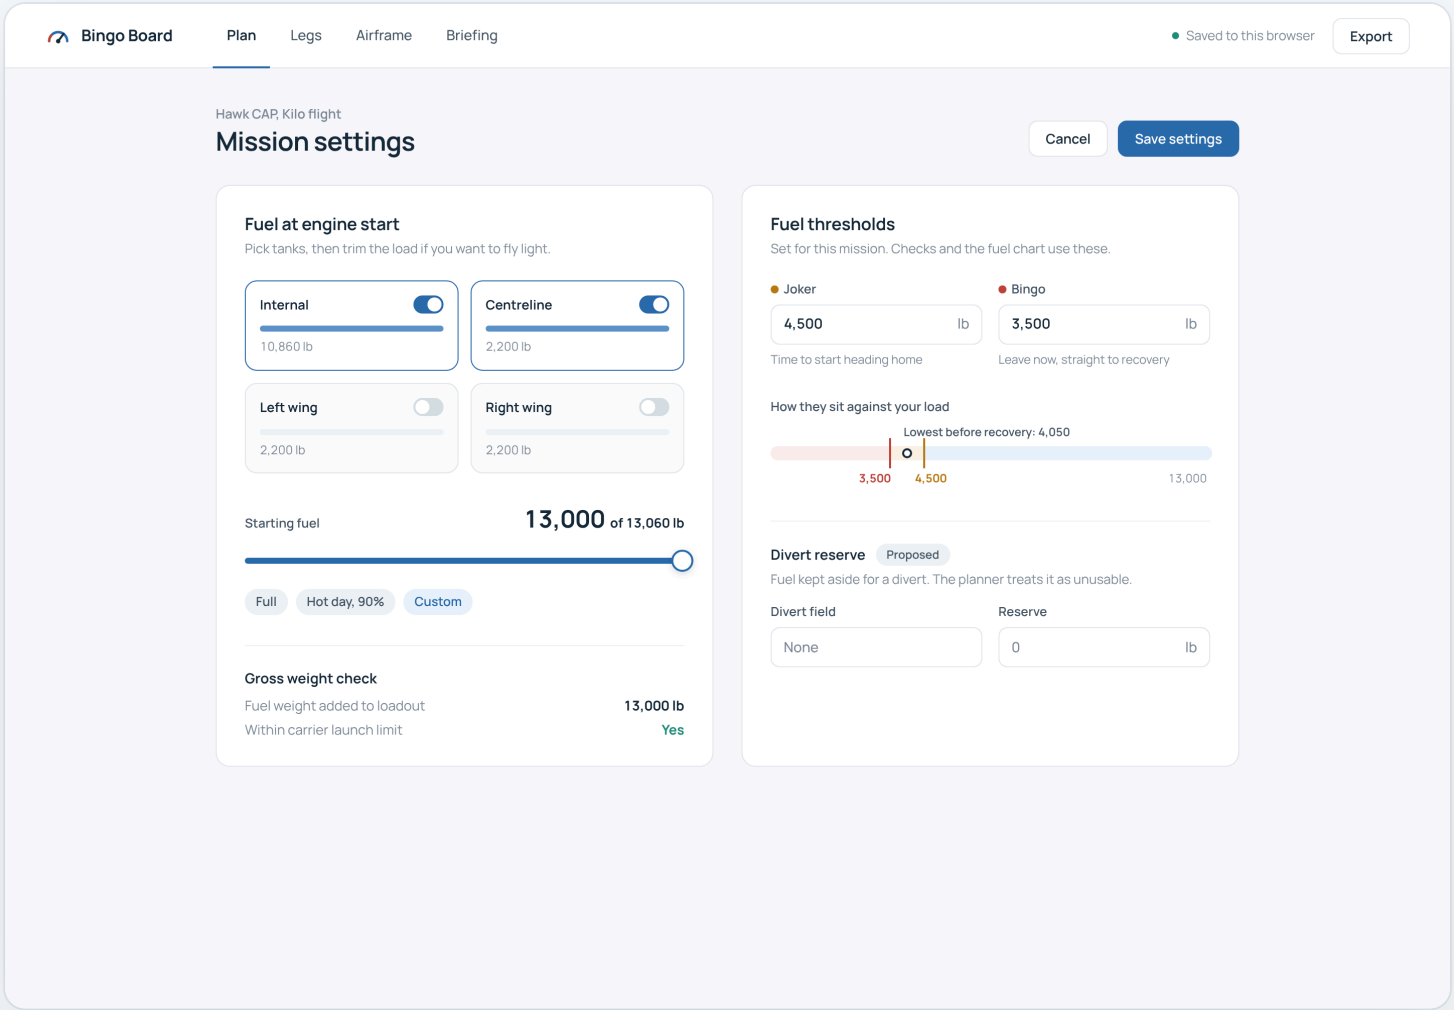

Screen 5 of 6

Mission settings

Mission-level inputs: what you start with and where the warnings sit. The threshold strip shows the lowest point against joker and bingo.

- Tank toggles set the maximum; the slider trims a lighter load.
- Thresholds are per mission, with plain-language hints.
- Divert reserve is shown as a proposal, matching the open question in the engine design doc.

Screen 6 of 6

Briefing and sharing

A printable kneeboard card with the essentials, alongside JSON export, import and autosave history.

- Card uses the same colours as the app, so joker and bingo read the same in the cockpit.
- JSON file is the sharing mechanism; no backend needed.
- Saved versions make localStorage autosave feel safe to experiment with.
